

Bot System Audit — Independent Review

Framework + sample report

Multi-department automation bots · evidence-based, scaling-safe

The problem

Teams that already run automation bots across departments want to scale further — but the seams between bots that are each individually "fine" are exactly where workflow gaps, silent failures, inflated metrics and lead leakage hide. An internal team stops seeing them; an external, evidence-based audit does not.

The deliverable

A structured audit in a fixed format so scope and output are unambiguous before any contract: **8 dimensions scored 0–5** (conversation design, workflow integrity, lead management, reporting accuracy, AI/LLM safety, reliability, scalability, security); a **9-phase methodology**; a **findings register** (evidence, impact, fix, effort, 4-tier severity); and a **remediation roadmap** sequenced quick-wins-first so workflows are hardened before more automation is added.

Methodology

discovery + access → **system mapping** (every bot on one page)
↳ heuristic review → transcript/log review → **adversarial probing**
↳ data reconciliation → findings + severity → **prioritised roadmap** → readout

The audit is adversarial and evidence-based — the live system is driven through edge cases, handoffs, prompt-injection and failure paths to reproduce issues, not theorise them. The repo ships the full framework plus a polished, anonymised sample report so the exact deliverable format is visible up front.

Why it matters: an external reviewer who has shipped these systems in production probes yours independently — so you know exactly what to fix, and in what order, before scaling further automation.
